

resource management

deliver what you promise

Success in today's business climate is not simply about winning new business and securing new projects. It's about delivery. Information, people, and time need to come together to keep a tight grip on projects, ensuring customer satisfaction and maximised profits.

Effective resource management begins with planning projects at the proposal stage. Using accurate and up-to-date information about resource availability is critical to developing a realistic proposal and setting delivery expectations. As soon as a project is initiated, it is equally important to capture data about actual time expended, by resource and task or activity.

As soon as a project is initiated, it is equally important to capture data about actual time expended

The process can then be measured across multiple projects, thus improving reliability of planning and optimising resource allocation, helping to deliver results on time and on budget.

When resource management is integrated into an organisation's overall project and programme management strategy, it has even greater value – it helps ensure that what's promised is delivered, consistently and reliably.

Perspective Solutions

The Perspective approach is supported by the RPM technology platform (Risk and Performance Management). RPM was designed in response to real-world needs.

Using recognised standards, RPM can be integrated with existing systems, within the enterprise as well enabling collaboration amongst partners, suppliers and customers. Implementation is swift, secure and the result easy to use.

Perspective Solutions delivers:

- best practice business process
- measurement and reporting on business process
- measurement and reporting on business risk and performance

At the centre of the Perspective Solutions' approach is Risk and Performance Management (RPM), a software solution designed to deliver the big picture quickly and accurately to managers at all levels. RPM consolidates project performance data across defined profiles, according to user defined rules and delivers that information in an interactive, graphical display. The underlying systems that create and manage the data are often already in place (such as Microsoft Project and Deltek® Vision), and

are easily and quickly integrated to eliminate duplicate data sources.

RPM provides a data entry capability for risks, issues, milestones and project financials when existing systems are not already in use.

Perspective also offers integration with leading resource management solutions to manage skills, availability and relevant financial information.

Key functionality:

- View skills available to take on new work
- Identify skills bottlenecks
- Assign staff to the most important tasks
- Support collaboration between project and resource managers
- Web based
- Collaborate and negotiate with other managers to share resource
- Permission based system to prevent people gaining unauthorised access to data or functionality
- Highlight under utilisation
- Search all resources to find most appropriate match
- Define project resource requirements
- Generate real-time reports on resources
- Integration with Microsoft Project
- Integration with Deltek® Vision

RPM consolidates project performance data across defined profiles, according to user defined rules and delivers that information in an interactive, graphical display.
